Darbā apkopotas ziņas par Rēzeknes rajonā 143 dendroloģiskajos stādījumos konstatētajiem 50 savvaļas un 185 introducētajiem koku un krūmu taksoniem. Pētījumi veikti no 1974. līdz 1998. gadam. Minētas atrašanās vietas kokiem, doti to izmēri.

**Raksturvārdi:** vietējās sugas, svešzemju sugas, koki un krūmi, Rēzeknes rajons.

### IEVADS

Darbā apkopoti dati par Rēzeknes rajonā konstatētajiem kokiem un krūmiem (235 koku un krūmu taksoni: 50 vietējie un 185 introducētie taksoni); dati iegūti, inventarizējot 143 objektus. Plašāki pētījumi R. Cinovska vadībā veikti 1974. un 1981. gadā. Vairāki kultūrvēsturiski un dendroloģiski vērtīgi objekti (Adamova, Labvārži, Lūznava, Prezma, Rikava u.c.) atkārtoti inventarizēti 1998. gadā. Floristiski īpaši bagātu dendroloģisko objektu rajonā nav. Dendroloģiski vērtīgākie ir parki Dricānos, Lūznavā, Taudejānos, Rikavā un Rozenmuižā, kuros konstatēti ap 40 taksonu.

Jāpiezīmē, ka pētījumā nav iekļautas atsevišķas pēdējos gados izveidotas privātkolekcijas un stādaudzētavas. Viena no šādām privātām kolekcijām atrodas pie Viļānu meža muzeja. Kopš 1990. gada to veidojusi Zaiga Graudiņa – šeit ir vairāk par 300 dendroloģisko taksonu. Lai arī stādījumi ir jauni un dendroloģiskā inventarizācija šeit nav veikta, tā noteikti ir viena no vislielākajām dendroloģiskajām kolekcijām Rēzeknes rajonā.

Inventarizācija dendroloģiskajos stādījumos veikta pēc vienotas Raimonda Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, "Zinātne").

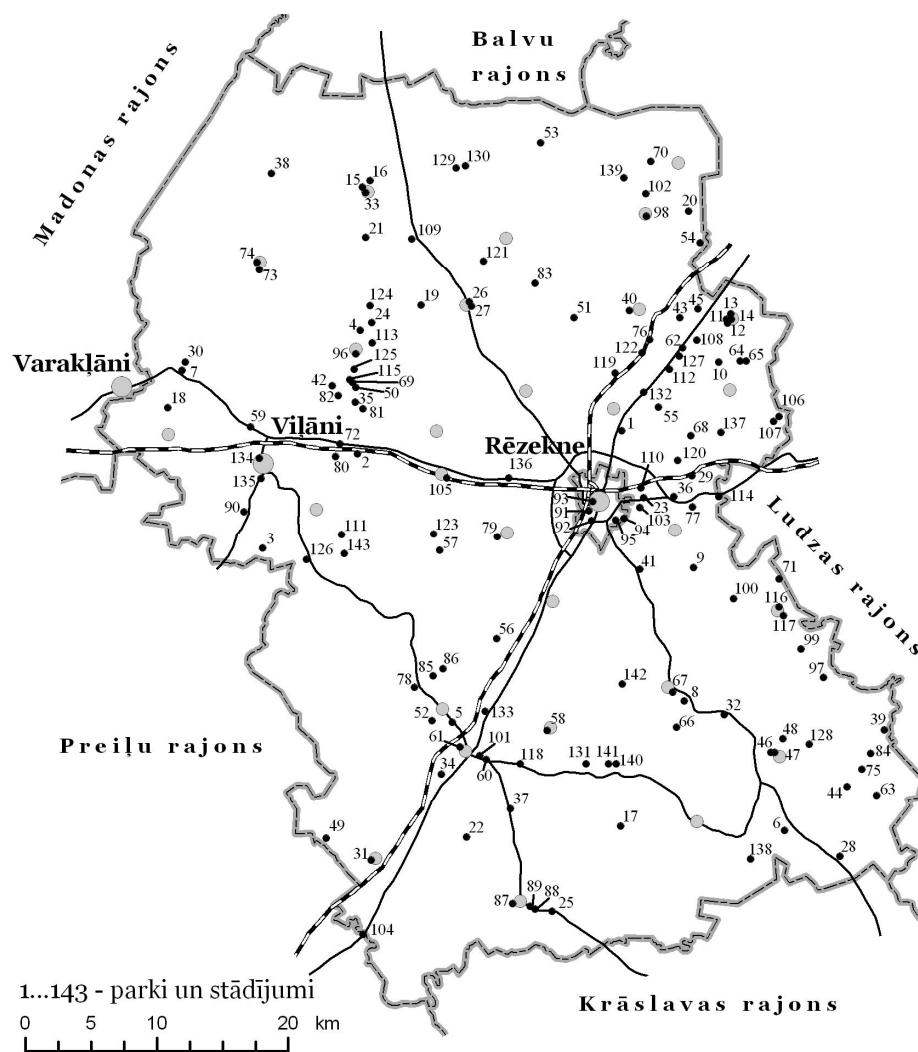

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums un stumbra caurmērs (1,3 m augstumā) vai apkārtmērs (ja stumbra caurmērs lielāks par 1m).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm);  $d_{0,8}$  – stumbra caurmērs citā (šai gadījumā 0,8 m) augstumā;  $d_{max}$  – resnāka koka stumbra caurmērs (cm) koku grupā; dendr. – dendroloģisks; dzīvž. – dzīvžogs; fragm. – fragments; gr. – koku vai krūmu grupa; h – koka augstums (m); kv. – meža kvartāls; m. – māja; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits, ja koku ir daudz (vairāk par 50),

bet precīzs skaits nav zināms; nog. – meža nogabals; p – stumbra apkārtmērs (cm); p. – parks; pag. – pagasts; stād. – stādījumi.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi: 12/15/20) un augstums, kā arī dažādas piezīmes. Atšķirībā no iepriekšējām sērijas publikācijām, ir dažas izmaiņas taksonu autoru rakstībā atbilstoši pasaulē pieņemtai rakstībai (“*Authors of Plant Names*”, 1992, Kew).
