Darbā apkopotas ziņas par dendroloģiskajiem stādījumiem 194 Rīgas rajona objektos. Pētījumi veikti no 1974. līdz 2005. gadam. Konstatēti 79 vietējie un 997 introducēti koku un krūmu taksoni. Minētas to atrašanās vietas, kokiem doti izmēri.

Raksturvārdi: vietējās sugas, svešzemju sugas, koki un krūmi

IEVADS

Rīgas rajonā laikā no 1974. līdz 2005. g. inventarizēti dendroloģiskie stādījumi 194 objektos: pilsētu un lauku (tai skaitā bijušo muižu, pusmuižu un mācītājmuižu) parkos, apstādījumos, kā arī atsevišķās privātās kolekcijās. Intensīvākie pētījumi R. Cinovska vadībā veikti līdz 1987. gadam. Pēc tam inventarizēti arī jauni objekti, kā arī vērtīgākie objekti inventarizēti atkārtoti.

Rīgas rajonā kopumā konstatēti 1076 koku un krūmu taksoni, t. sk. 79 vietējie un 997 introducēti. Šajā publikācijā nesniedzam ziņas par Nacionālajā botāniskajā dārzā un Baltezera kokaudzētavā savāktajām kolekcijām, kā arī neesam inventarizējuši virkni pēdējos gados izveidotu stādījumu un privāto kolekciju.

Rajonā ir vairāki lieli parki. No vecajiem parkiem sugām bagātākie ir Baldones sanatorijas, Mālpils, Ropažu, Sējas un Zaķumuižas parks. Sējas parkā aug dižākais Baltijas ozols. Baltāspils parka lepnums ir Amūras korķkoki.

Stādījumus Baldones “Rozītēs” 20. gados uzsācis veidot LU profesors P. Galenieks. Tur saglabājušās vairākas reti audzētas skujkoku sugas, Japānas katsura, retas rožu sugas u.c.

Ar sortimenta daudzveidību izceļas Ādažu centra apstādījumi, stādījumi pie Katlakalna baznīcas, jeb Katlakalna priedes un pie Daugavas vēstures muzeja Doles salā.

Dziedātājas A. Ludiņas 1964. g. izveidotajā Mākslinieku dārzā Inčukalna “Līgotnēs” iestādītas daudzas retu koku sugas, kā arī šķirnes.

Izcila vērtība ir profesora A. Mauriņa kolekcijai Salaspilī. Te savākti daudzi Latvijā reti audzēti augi, kuriem jāvelta īpaša aprūpe. Salaspils klimatiskajos apstākļos profesoram ir izdevies atlasīt izturīgus augus no sugām, kas parasti bargākās ziemās aiziet bojā, kā piemēram, *Campsis radicans*, *Juglans regia*, *Paeonia suffruticosa*, *Parthenocissus tricuspidata* ‘Veitchii’ u.c.

A. Bērziņš Saulkrastu “Kāpās-2” savācis daudzus Latvijas savvaļas, kā arī parasti reti audzētus svešzemju kokus un krūmus.

Lielākās g.k. zemo skuju koku, dekoratīvo krūmu un vītenaugu kolekcijas ir L. Līgotnei Krimuldas “Vārpās”, M. Vikmanim Siguldā un dārzkopīvas sabiedrības “Āres” apstādījumos Carnikavā.

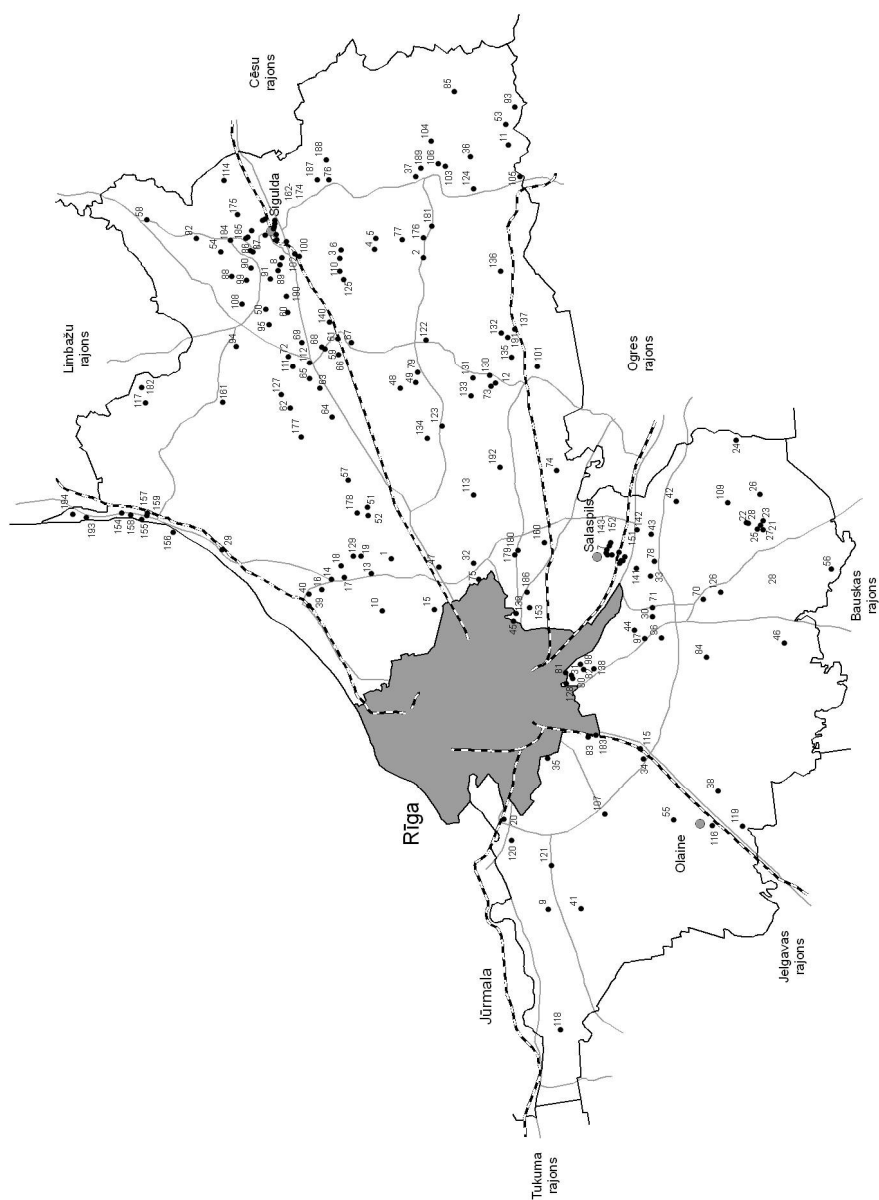

Inventarizācija dendroloģiskajos stādījumos veikta pēc vienotas Raimonda Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, “Zinātne”).

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums, stumbra caurmērs (1,3 m augstumā) un apkārtmērs (ja stumbra caurmērs lielāks par 1 m).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d - stumbra caurmērs krūšaugstumā (cm); $d_{0,8}$ – stumbra caurmērs citā (šai gadījumā 0,8 m) augstumā; d_{max} – resnākā koka stumbra caurmērs (cm) koku grupā; dzīvž. – dzīvžogs; fragm. – fragments; h – koka augstums (m); kv. – meža kvartāls; lit. – liters; l.t. – lauku teritorija; kv. – meža kvartāls; m. – māja; m.m. – mācītājmāja (mācītājmuiža); p – stumbra apkārtmērs (cm); p. – parks; pag. – pagasts.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi: 13/15/25) un augstums, kā arī dažādas piezīmes.
