Jagiellonian University in Kraków

5th INTERNATIONAL CONFERENCE

Old-growth forests: policy and practice

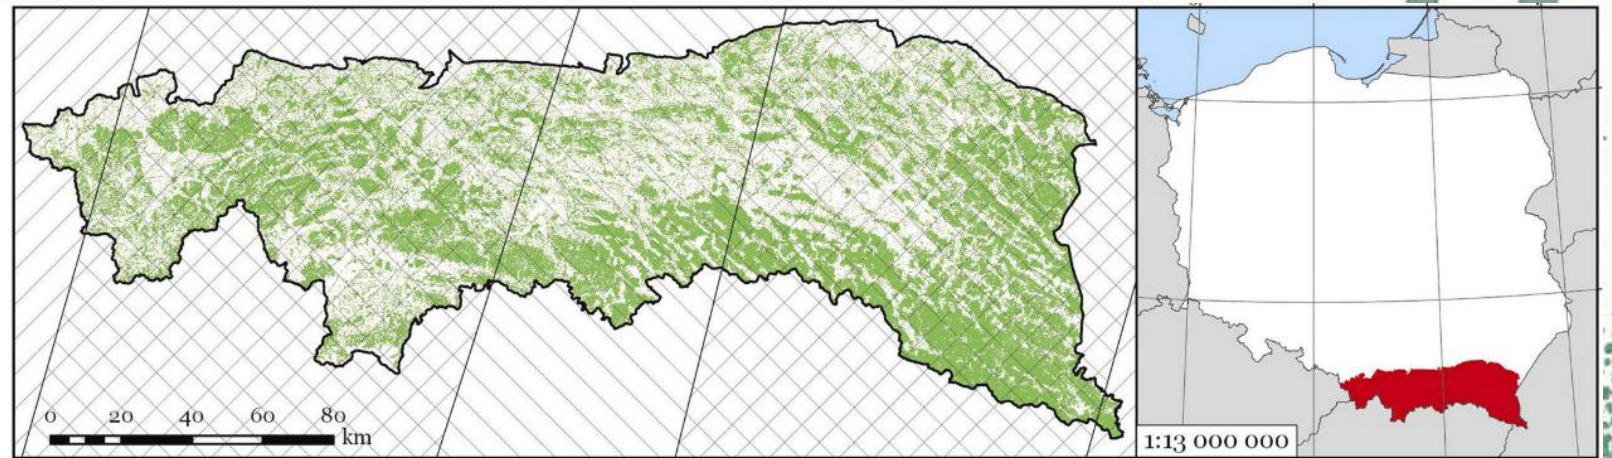

High Conservation Value Forests (HCVFs)

- Biodiversity – maintain diverse species and habitats
- Rare ecosystems – support threatened or unique ecological communities
- Ecosystem services – watershed protection, erosion control
- Cultural value for local communities
- Beyond primary and old-growth, HCVFs include early successional, multi-aged, riparian, and previously managed forests

HCVFs in the Polish Carpathians

- Growing emphasis on ecosystem protection in Europe (Biodiversity Strategy, Nature Restoration Law) - identifying HCVFs is essential
- Polish Carpathians: diverse, ecologically valuable forests, biodiversity hotspot with many HCVFs unprotected
- Objective to identify & classify HCVFs using remote sensing + historical maps

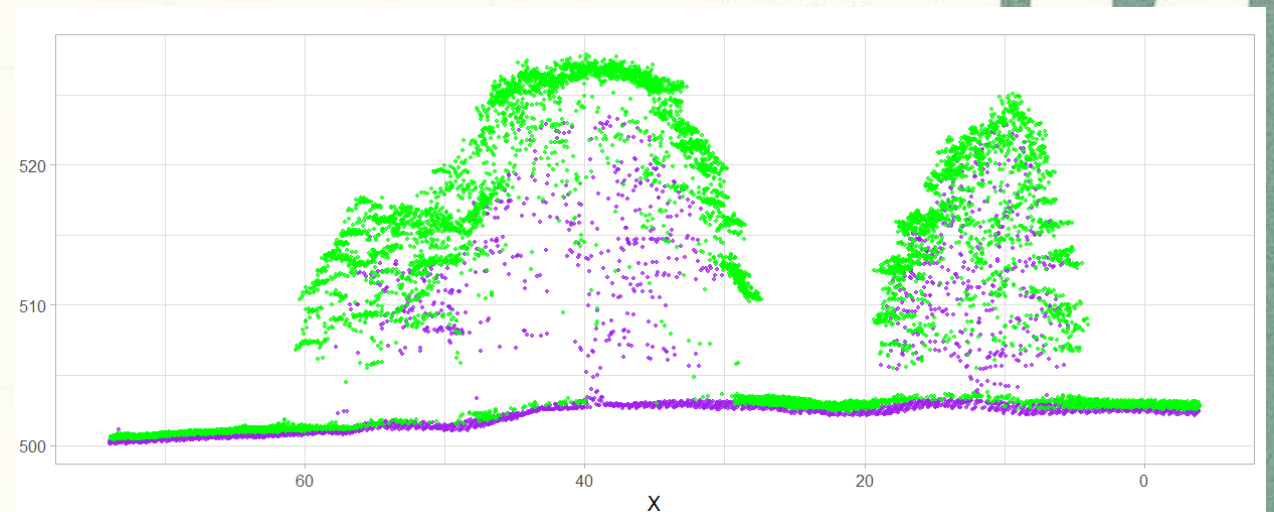

Datasets

Historical maps (19th century, 1930s, 1970s)

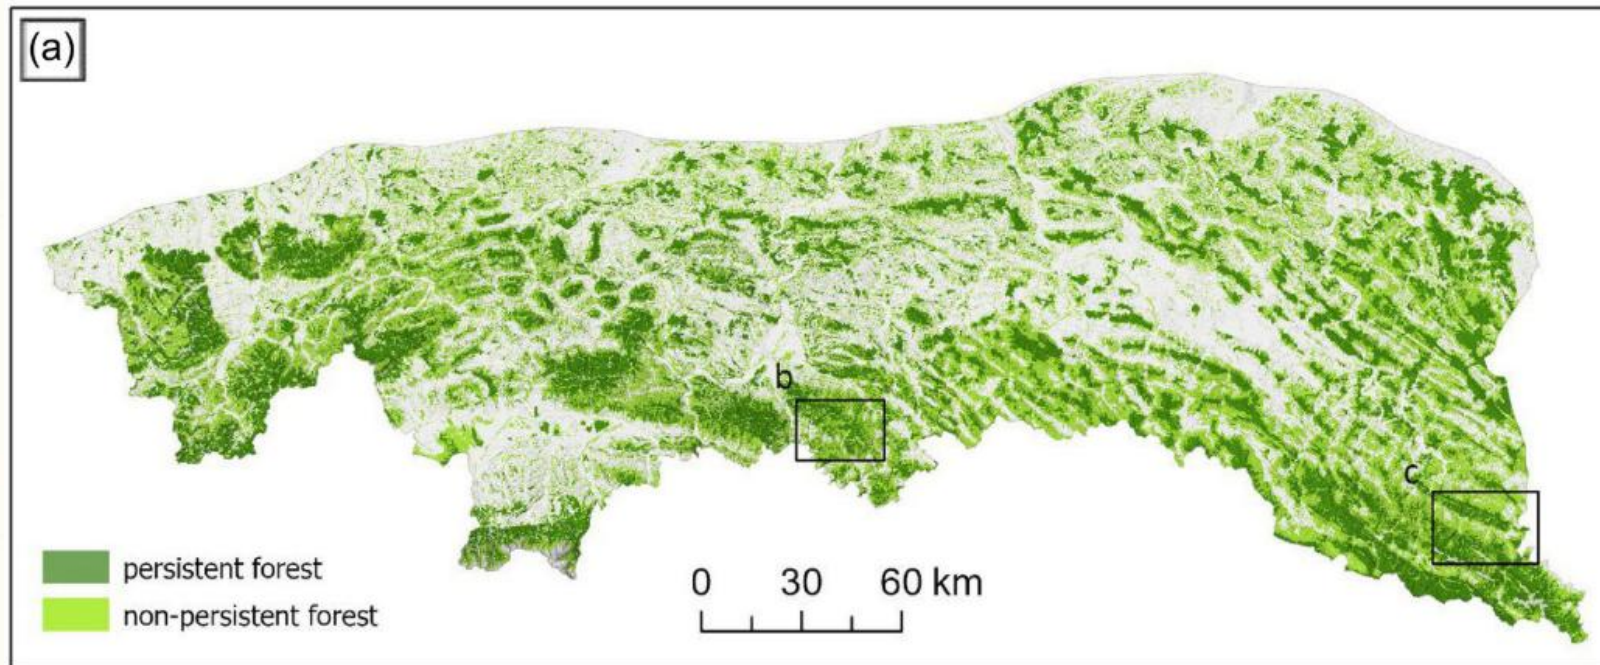

Remote sensing:

- Sentinel-2, Landsat
- LiDAR

Forest continuity

- Forest continuity: long-term forest presence without land-use conversion (e.g., agriculture).
- Mid-19th c.: minimum forest extent; stands present then likely have long continuity.
- Data: 5 time periods (1860s, 1930s, 1970s, 2013, 2023) → “**persistent forests**”
- Result: 4,200 km² identified; ~50% outside protected areas.

LETTER

Historical maps improve the identification of forests with potentially high conservation value

Persistent forests

Map of forest tree species for Poland based on Sentinel-2 data

Ewa Grabska-Szwagrzyk¹, Dirk Tiede², Martin Sudmanns², and Jacek Kozak¹

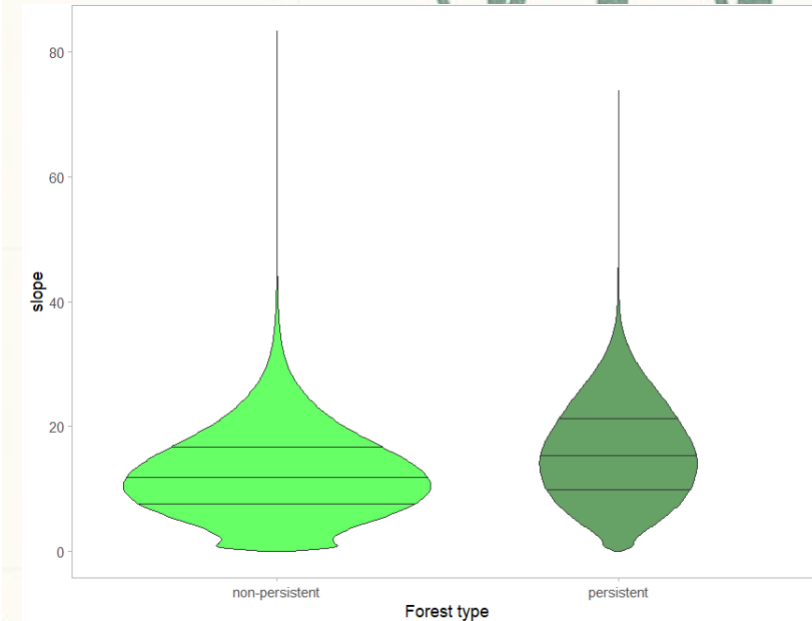

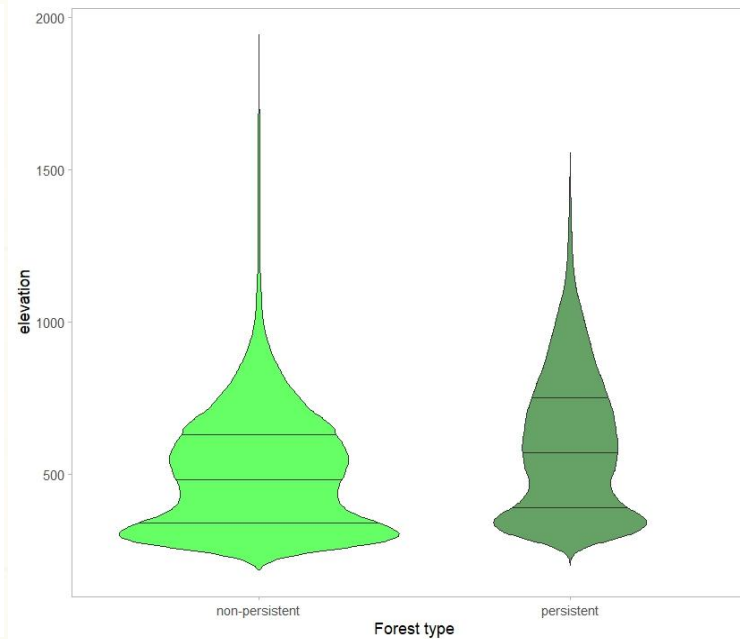

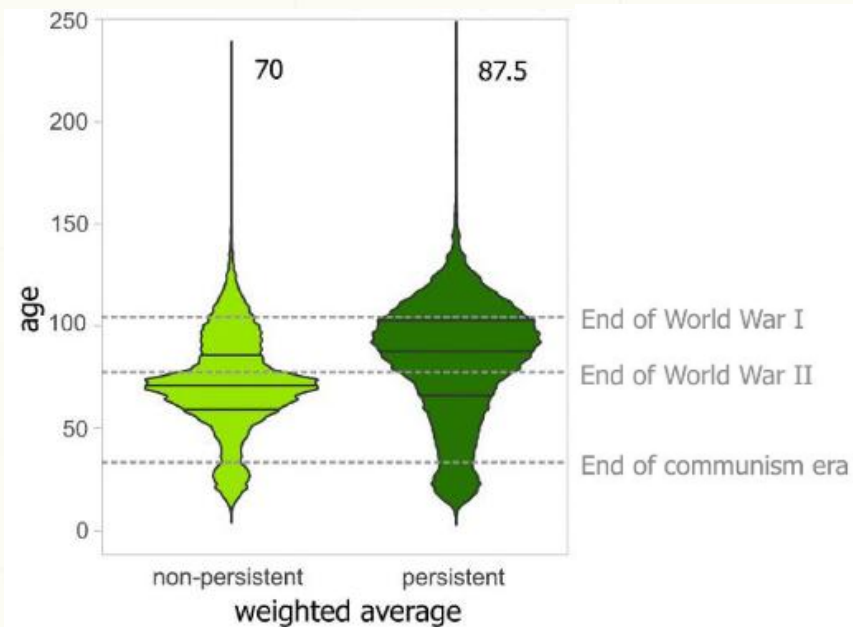

- Based on Sentinel-2 forest tree species classification

Persistent vs non-persistent forests

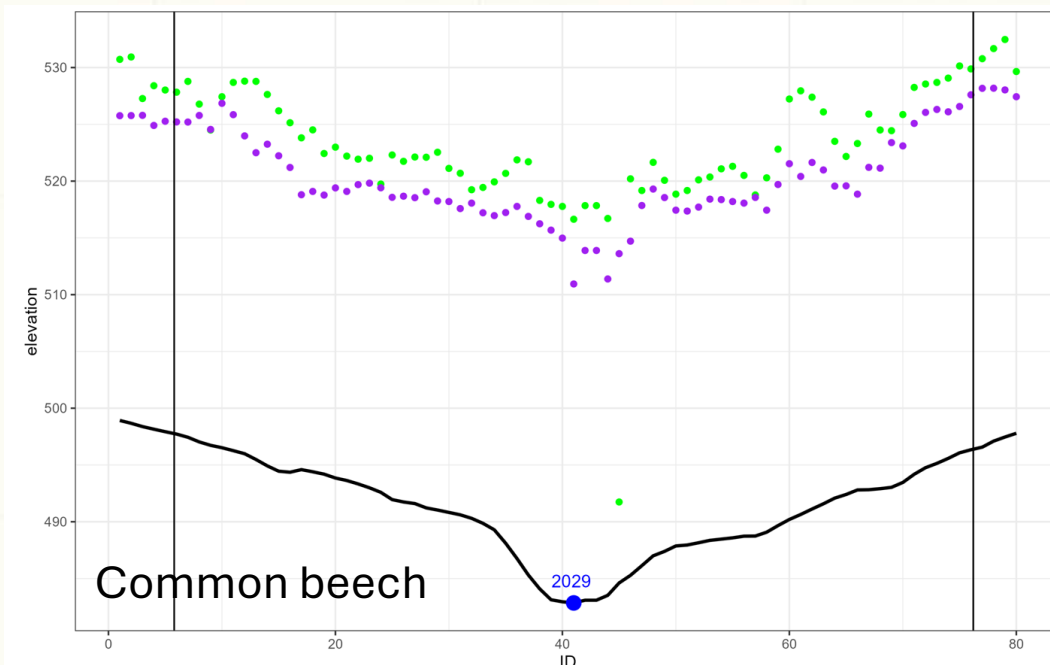

Age and topography:

- Stand age from Polish Forest Data Bank
- DEM

Identification of riparian & persistent forests

- Riparian forests- along riverbanks and other freshwater bodies
- Study in Maków Beskid (434 km²); use of Canopy Height Model
- Definition based on tree heights (mean 20% highest) transformed into horizontal distance from the stream

16 km² of persistent and riparian forests in Maków Beskids

64% - fir; 21% - beech; alder; pine; spruce; larch

Lidar profiles and dynamics

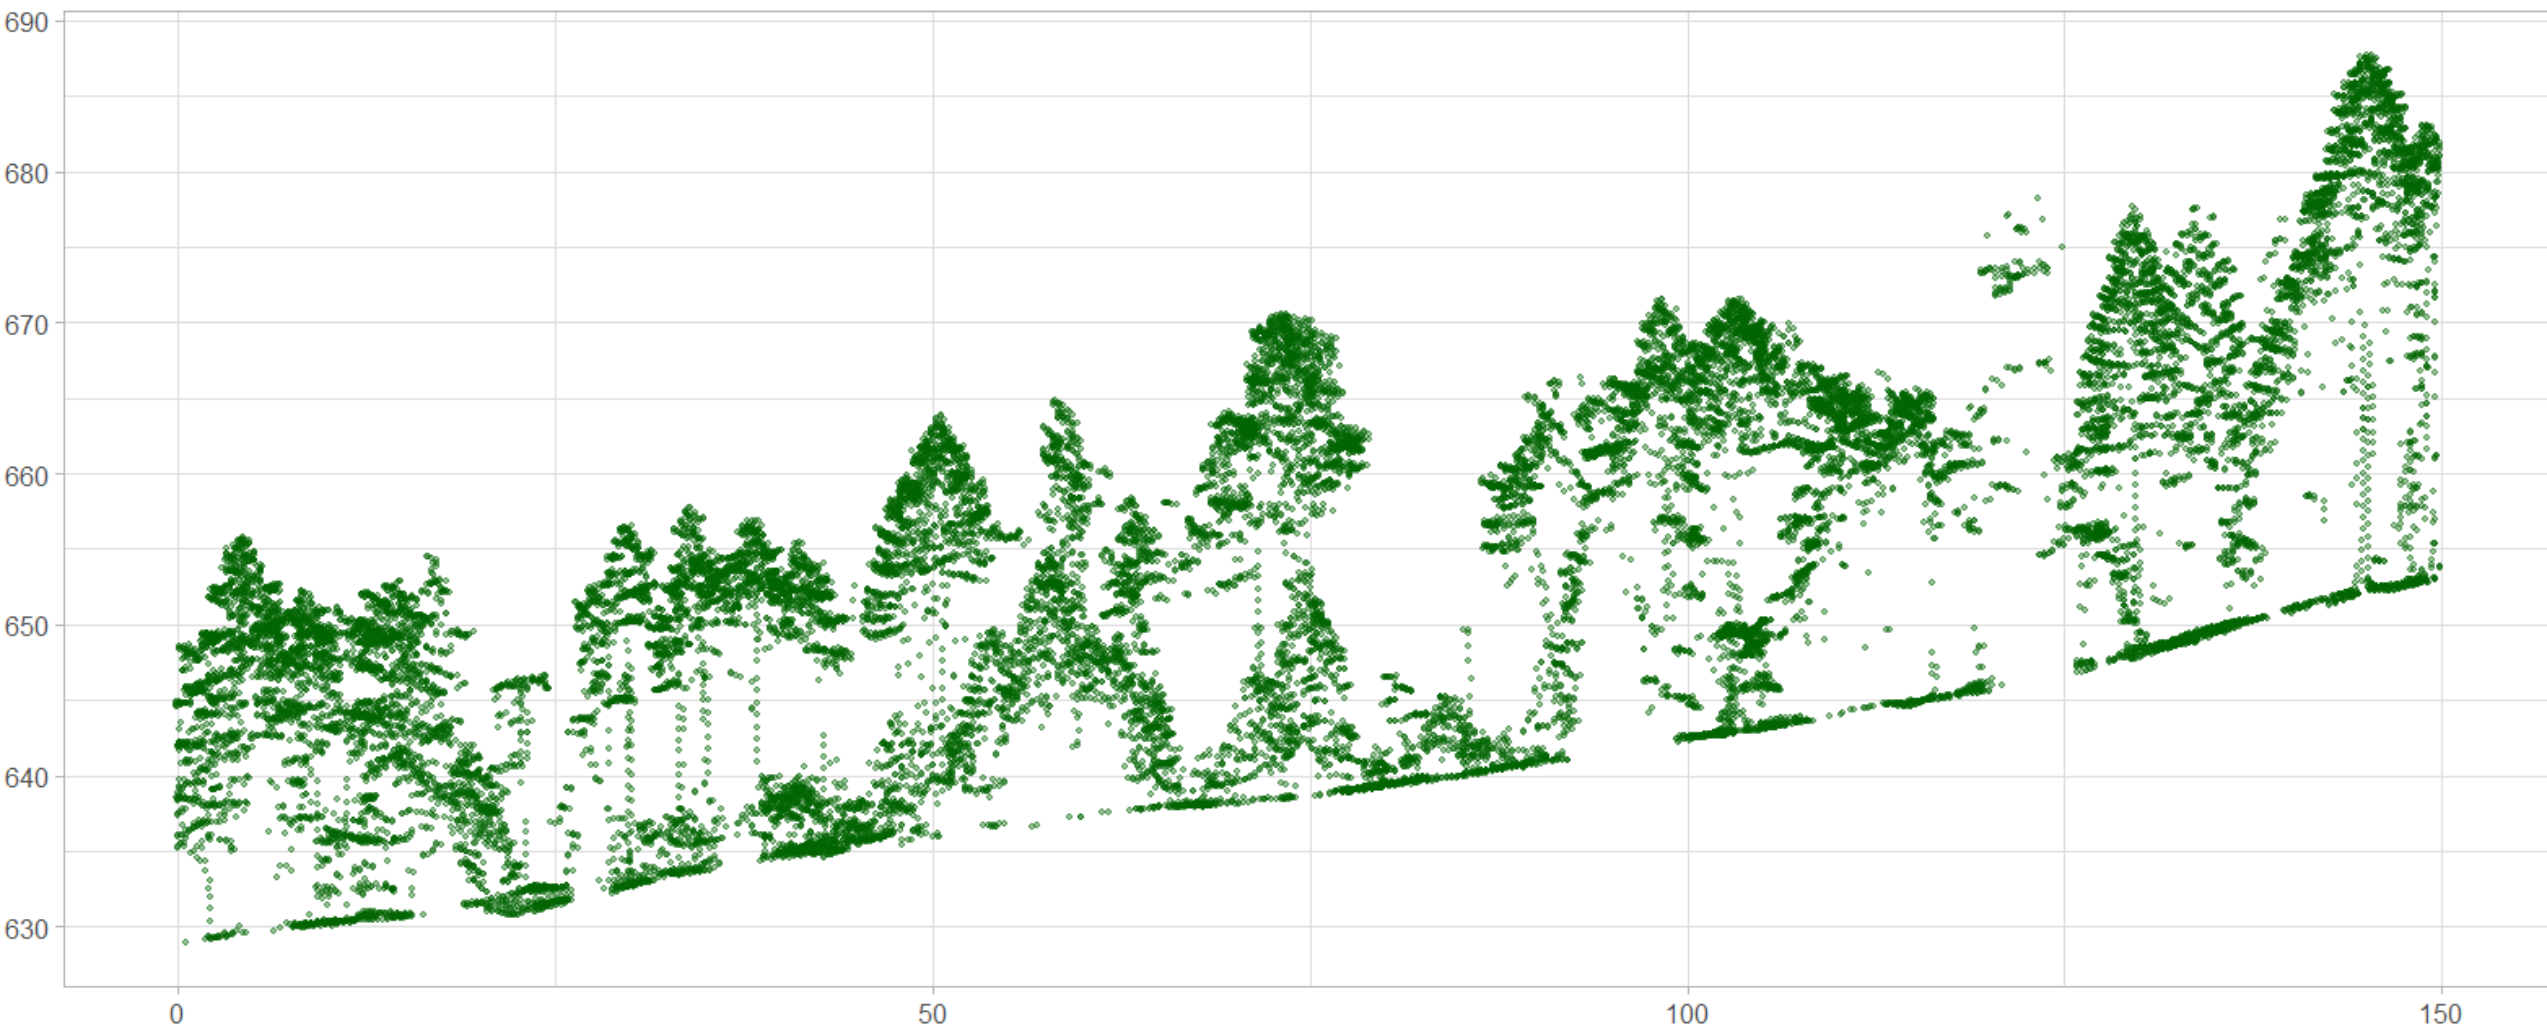

Old-growth – Śnieżnica Nature preserve with nearly 200 years old common beech

Dynamics in HCVPFs - Sentinel-2 time series

Uneven aged stands

Conclusions & perspectives

- Different data → different HCVF attributes
 - Historical maps: persistent forests
 - Satellites: recent dynamics
 - LiDAR: structure & canopy
- Recommendations
 - Integrate multi-source data
 - Focus on persistence & legacy areas
 - Test in other regions

Thank you for your attention!
